DIGITAL OPERATOR INSTRUCTIONS

HAND-HELD TYPE FOR AC SERVOPACK TYPE SGD, SGDA, SGDB, SGDE, DR2 TYPE JUSP-OP02A-1

Before initial operation, read these instructions thoroughly, and retain for future reference.

NOTES

(1) Factory setting of Cn-04 (speed loop gain) is determined by the follow-ing conditions:

Load inertia ≤ motor inertia x3

Be sure to set the value of Cn-04 to 40 or less when motor is rotated without load. If the value has been kept at the factory setting, the motor may oscillate.

- (2) The encoder has been preset to incremental encoder 2048Pulses/Rev at the factory prior to shipment. When another encoder is used, set bit E of user constants Cn-11 and Cn-01.
- (3) AC SERVOPACK (type SGD, SGDA, and SGDE) has two control types; speed control (torque control) and positioning control. Since each has different operations, make sure of your SERVOPACK type and read the section stated in Table 1.1 for each operation.
- (4) AC SERVOPACK (type SGDB and DR2) has two control types, depending on user constant selection-position control and speed control (torque control). Since each has different operations, make sure of your SERVOPACK type and read the section stated in Table 1.1 for each operation.
- (5) Mounted-type digital operator (type JUSP-0P03A) is also available for SERVOPACK (type SGD, SGDA, SGDB, and SGDE). For mounted-type, refer to the instruction manual (TOE-S800-15.4). Only a hand-held type digital operator can be used with type DR2 SERVOPACK.
- (6) Digital operator (type JUSP-OP02A) for SERVOPACK (type DR1) requires a different connecting cable.

1. OUTLINE OF THIS MANUAL

AC SERVOPACK (type SGD, SGDA, and SGDE) has two control types; speed control (torque control) and positioning control. Since each has different operations, make sure of your SERVOPACK type and read the section stated in Table 1.1 for each operation.

AC SERVOPACK (type SGDB, DR2) also has two control types, speed control (Torque control) and positioning control, depending on user constant selection.

Table 1.1 Outline of This Manual

SERVOPACK type	Digital Operator	Section	Page
For Speed Control (Torque Control) SGDA: SSSGDE: SSSGDE: SSSGDE: SSSGDE: SSSGDE: SSSGDE: SSSGDE: SSGDE: SSG	Hand·held Type (type : JUSP-OP02A-1)	2	5 to 52
For Position Control SGDA P SGDE P SGD-P SGDB D DR2 C	Hand-held Type (type : JUSP-OP02A-1)	3	53 to 101

2. OPERATION METHOD OF HAND-HELD TYPE DIGITAL OPERATOR (JUSP-OPO2A-1) FOR SPEED (TORQUE) CONTROL

This section explains the operation method when SERVOPACK for speed control (torque control) is operated using a hand-held type digital operator (JUSP-OP02A-1).

2.1 SWITCH OPERATION

Fig.2.1 shows the digital operator. The digital operator has various functions as listed by modes in Par.2.2, "DIGITAL OPERATOR FUNCTIONS" (p.6).

- The data set by the digital operator is retained in SERVOPACK even after the power is turned OFF.
- Even if the power is turned OFF after fault occurrence, the fault data is retained in memory.Therefore, it is possible to check the fault data after the power is turned back ON.
- 3. The monitor mode can be changed even during operations.

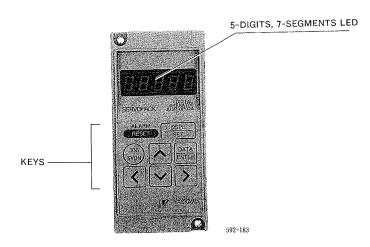

Fig. 2.1 DIGITAL OPERATOR (HAND HELD TYPE) JUSP-OP02A-1

2.2 DIGITAL OPERATOR FUNCTIONS

Table 2.1 shows the digital operator's functions. The status display is the default when control power is turned ON. To change the mode, use

DSPL SET

key as shown in Fig.2.2.

Table 2.1 Digital Operator Functions

Mode	Function	
Status Indication Mode	Various Status Indications Base Block On Operation Fault	(See Par.2.3)
Setting Mode	Refer to "User Constant Setting." Operation (JOG) from digital operator Speed Reference / Torque Reference Offset Adjustment Clearing Fault Traceback Data	(See Par. 2.4.5)
	Check of Motor Auto Tuning Check of Software Version	(See Par.2.4.7) (See Par.2.4.8) (See Par.2.4.9)
Monitor Mode	Various Monitoring Speed Speed Reference Torque Reference Number of Pulses from Origin (Phase-U) Electrical Angle Internal Status Bit	(See Par. 2.5)
Fault Traceback Indication Mode	Fault History	(See Par. 2.6)

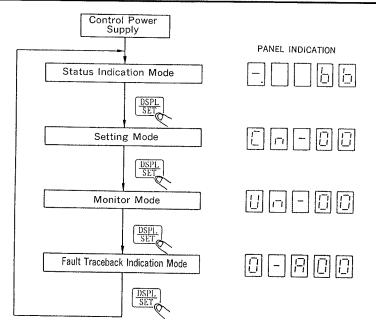

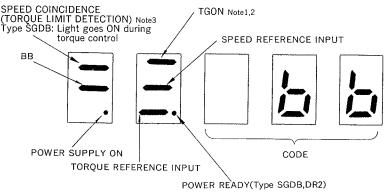

Fig. 2.2 Mode Changeover

2.3 STATUS INDICATION MODE

When this mode is selected, the condition of SERVOPACK is indicated with bits and codes as shown in Fig.2.3. Table 2.2 shows the bit data contents. Table 2.3 shows the codes and conditions.

ALARM RESET): Alarm reset switch

Panel Display

- TGON or current limit detection is displayed according to bit 4 of user constant Cn-01 (Type SGD, SGDA, SGDE). TGON is displayed at type DR2.
- TGON or brake interlock signal is displayed according to bit E of user constant Cn-01 (Type DR2).
- Torque limit detection or speed agreed can be selected according to bit 4 of user constant Cn-01 (Type DR2).

Table 2.3 Status Indication Mode

2.3 STATUS INDICATION MODE (Cont'd)

Table 2.2 Bit Data Contents

Bit Data	Contents	Remarks	
Power Supply ON	Light goes ON with power supply ON. Light goes OFF with power supply OFF.	Type SGDA, SGDE, SGD	
	Light goes ON with control power supply ON. Light goes OFF with control power supply OFF.	Type SGDB	
ВВ	Light goes ON with base block, and goes OFF with servo ON.		
Speed Agreed	Light goes ON when motor rotating speed reaches internal speed reference set by a speed reference or parameter.		
Torque Limit Detection	Light goes ON when internal torque reference is higher than torque limit detection level.	Type DR2 : Selected by bit 4 of user constant Cn-01	
TGON	Light goes ON with motor rotating speed higher than TGON level.	Type SGD, SGDA, SGDE : Selected by	
Torque Limit Detection	Light goes ON when torque reference reaches the torque limit value.	bit 4 of user constant Cn-01. Type SGDB : TGON	
TGON	Light goes ON with motor rotating speed higher than TGON level.	Type DR2 :	
Brake Interlock Signal	Light goes ON when brake is released at brake interlock ON.	Selected by bit E of user constant Cn-01.	
Speed Reference Input	Light goes ON with speed reference input equal to or higher than TGON level.		
Torque Reference Input	Light goes ON with torque reference input less than 10% of rated torque.	Only at torque control	
Power Ready (Main Circuit Power Supply ON)	Light goes ON when main circuit power supply is normal.	Type SGDB, DR2	

Table 2.3 Codes and Status

Code	Status
ბხ	Base Block
run	On Operation
Pob	Forward Running Prohibited
nob	Reverse Running Prohibited
R, 00	Ararm Status Refer to Table 2.9.

2.4 SETTING MODE

In this mode, the following operations can be performed.

- OUser constant setup and monitor
- Jog operations from the digital operator
- Offset adjustment
- Fault traceback data clearing
- Check of motor
- Auto tuning
- Check of software version

2.4.1 User Constant (Data) Setup and Monitor (Cn-03 to Cn-23)

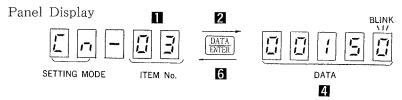

Fig. 2.4 User Constant Setting

- \blacksquare Set up the item number with the \frown , \bigvee , \bigcirc , or \bigcirc key.
 - With the or key, choose a setup digit. The chosen digit starts blinking to indicate that its numerical value can be changed.
 - •With the or wkey, increase or decrease the numerical value until the desired value is obtained.
- With the DATA ENTER key, display the data related to the selected item number.
- 3 With the ⋀, ⋁, , or > key, set up the data. (The same operation as stated in ■.)
- 4 Retain the data with the $\frac{\text{DSPL}}{\text{SET}}$ key.
- **5** With the DATA key, return to the item No. display status.
- 6 Repeat steps 1 through 5 as needed.
- Using the SET key, switch from the setting mode to the monitor mode.

2.4.1 User Constant (Data) Setup and Monitor (Con't d)

Table 2.4, 2.5, 2.6, 2.7, and 2.8 show user constants (Constant Setting)

100% = rated torque

Notes:

Load inertia \leq motor inertia \times 3 Be sure to set the value of Cn-04 to 40 or less when motor is rotated without load. If the value has

been kept at the factory setting, the motor may oscillate.

- 2. After modifying Cn-0A (PG division ratio setting), and Cn-11(number of encoder pulses setting), turn OFF power and start up again. The modified value takes effect only after restarting.
- 3. Cn-1A (position loop gain) is required when zero-clamp function is used.
- 4. When soft start function is used, both Cn-07 and Cn-23 should be set.

^{1.} Factory setting of Cn-04(speed loop gain) is determined by the following conditions:

: User constants that must be always set

After changing the setting, always turn the power OFF, then ON. This makes the new setting valid.

²⁾ Automatically set by autotuning function.

³⁾ Valid only when zero-clamp function is used.

⁴⁾ To use soft start function, always set both Cn-07 and Cn-23.

2.4.2 User Constant (Memory Switch) Setup and monitor (Cn-01 to Cn-02)

Memory switches Cn-01 and Cn-02 can be set up or monitored as memory switch bits. The procedures for item number setup and data display are the same as indicated in Par.2.4.1 11 and 21.

Panel Display

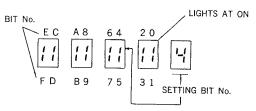

Fig. 2.5 Bit Data Display

- With the or key, enter the setup memory switch bit No.
 at the far right end of the panel.
- With the \(\shc \) key, set the memory switch to ON or OFF (either \(\shc \) or \(\subseteq \) can be used). The panel indication comes on when the switch is ON, and goes off when the switch is OFF.
- 3 Repeat steps 11 and 2 as needed.
- 4 Retain the data with the $\frac{\text{DSPL}}{\text{SET}}$ key.
- **5** With the $\frac{\text{DATA}}{\text{ENTER}}$ key, return to the item No. display status.
- 6 Using the SET key, switch from the setting mode to the monitor mode.

Table 2.9, 2.11, 2.13, 2.15, 2.17 show memory switches of user constant Cn-01, and Table 2.10, 2.12, 2.14, 2.16 and 2.18 those of user constant Cn-02.

Note: When the setting of user constants Cn-01 and Cn-02 are changed, turn OFF the power supply once and restart the operation.

Table 2.9 Type SGD User Constant Cn-01 (Memory Switch) List

Selection	Bit No.	Setting	Conditions	Standard																		
	0	0	Servo ON / OFF by external input (SV-ON).	0																		
		1	The servo is ON at all times.] 0																		
	1	0	The external input (SEN) is used.																			
Sequence Input	(ABSO. PG only)	1	Regardless of the SEN signal presence, SGD SERVOPACK automatically concludes that the "H" level prevails.	0																		
Selection	2	0	The P-OT signal prohibits forward running.																			
		1	Forward running is permitted at all times.	0																		
	3	0	The N-OT signal permits reverse running.																			
	3	1	Reverse running is permitted at all times.	0																		
Sequence Output Signal	4	0	$\overline{\text{TGON}}$ signal is used as a signal output when rotating is detected. $(\overline{\text{TGON}})$	0																		
Changeover (TGON)		1	TGON signal is used as a signal when current limit is detected.																			
Treatment of Momentary		0	Maintains the servo alarm status at momentary power loss reset.																			
Power Loss Reset	5	1	Clears the servo alarm status automatically at momentary power loss reset.	0																		
		0	<db stop=""></db>																			
	6	6	6	6	6	6	6	6	6	6	6	6	6	6	6	6	6	6	6	-	The dynamic brake stops the motor.	0
		1	Coasting to a stop>																			
			The motor is freed and brought to a stop.																			
	7	7	7	0	<db after="" db="" off="" stop=""> The dynamic brake is turned OFF after the motor is stopped.</db>																	
				7		<db after="" continuously="" db="" on="" stop=""></db>	1															
Fault Stop		1	The dynamic brake remains activated after the motor is stopped.																			
Selection	Note 1	0	The overtravel status stop method coincides with bit 6.																			
			<overtravel speed="" stop="" zero=""></overtravel>	1 0																		
		1	In the overtravel status, the motor is stopped at the torque setting defined by user constant $\mbox{Cn-}06.$																			
	Note 2	0	In the overtravel status, base blocking (BB) is implemented after the motor stops. $ \\$																			
	9	1	In the overtravel status, zero clamping is effected after the motor stops.	0																		
		0 • 0	<torque reference=""> Based on the torque reference level defined by user constant Cn-0C.</torque>																			
Mode	Note 3	0 • 1	<pre><speed reference=""> Based on the speed reference level defined by user constant Cn-0D.</speed></pre>	1																		
Switch Selection	D·C	1 • 0	<acceleration> Based on the acceleration level defined by user constant Cn-0E.</acceleration>	0																		
		1 • 1	None> The mode switch function is not provided.	1																		
Encoder		0	Incremental encoder																			
Encoder Selection	E	1	Absolute encoder	0																		
	F		Don't change.	0																		
	L'			U																		

Notes:

The fault stop method in the torque control mode complies with bit 6 Selects the status based on the stop method selected for the overtravel status (bit 8). Selects the mode switch operating condition. When the mode switch operates, the speed control mode changes from $P \cdot 1$ control to P control. (Effective only for speed control) When the setting of user constant $Cn \cdot 01$ is changed, turn OFF the power supply and restart the operation.

Table 2.9 Type SGD User Constant Cn-01 (Memory Switch) List (Cont'd)

Selection	Bit No.	Setting	Description	Reference Input	Sequence Signal Input	Standard
	В∙А	0 • 0	Speed control Regular speed control The P-CON signal (1CN-15) is used to effect P/PI control changeover	Speed reference (V-REF)	P-CON OFF:PI control ON:P control	0.0
		0 • 1	<zero clamp="" control="" speed=""> After the motor is stopped (ZCLVL), the speed reference is disconnected to execute the zero speed stop function. After this, it maintains the servo lock status. The P-CON signal (ICN-15) is used to turn the zero clamp function ON and OFF. </zero>		P-CON OFF: Zero clamp function OFF ON: Zero clamp function ON	
		1 • 0	<torque control="" i=""> The motor output torque is controlled by the torque reference (T-REF). The V-REF cannot be used. </torque>	Torque reference (T-REF)	None	
Control Mode Selection		1 • 1	Torque control II > The P-CON signal (1CN-15) is used for torque / speed control mode changeover. Torque control mode The motor output torque is controlled by the torque reference (T-REF). The speed limit can be entered from outside (V-REF). The V-REF voltage (+) limits both the forward and reverse running speeds. MOTOR SPEED SPEED LIMIT RANGE V-REF V-REF Speed control mode The speed reference is entered from the V-REF.	At torque control, Torque reference: I-REF Speed reference: V-REF At speed control, Speed reference: V-REF Notes: If speed goes beyond the limit negative feedback of torque in proportion to speed difference from limit speed occurs to restore moderate speed. Therefore width of actual motor rotation speed limit depends on load conditions. In case of continuous regeneration tension control Please contact your local YASKAWA		

2.4.2 User Constant (Memory Switch) Setup and Monitor (Cn-01 to Cn-02) (Cont'd)

Table 2.10 User Constant Cn-02 (Memory Switch) List

Torque	F	0	1	0		
reference input selection		Uses torque reference or torque feed-forward reference.	Uses analog voltage reference as torque limit input.			

Notes:

 $1. \ \mbox{The factory setting depends on the SERVOPACK type as shown below.}$

SERVOPACK Type	Factory Setting
DR2-□	0
DR2-□P	1

2. For the Cn-01 and Cn-02 memory switches, always turn the power OFF and then ON after changing the setting. This makes the new setting valid.

2.4.3 Digital Operator Jog Operation Mode Selection and Operating Procedure

(1) Digital Operator Jog Operation Mode Selection

When using this function during set up and test runs, external circuits or other devices do not have to be connected to the digital operator. When user constant Cn-00 is set to 00, the operations are to be controlled from the digital operator.

Panel Display

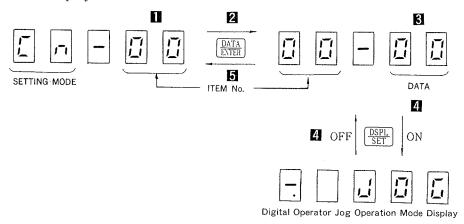

Fig. 2.6 Digital Operator Jog Operation Mode

- 2 With the $\frac{DATA}{ENTER}$ key, display the data related to the selected item number.
- \blacksquare With the \frown , \bigcirc , \bigcirc or \bigcirc key, select the number 00.
- With the DSPL key, turn ON or OFF the monitor panel jog operation mode.
- **5** With the $\frac{\text{DATA}}{\text{ENTER}}$ key, return to the item No. display status.
- 6 Using the SET key, switch from the setting mode to the monitor mode.

		_			
(2)	Digital	Operator	Jog	Operation	Procedure

For speed reference adjustment, use user constant Cn-10 (see Table 2.4).

- With the (JOG) switch, effect SVON/SVOFF changeover.
- 2 The motor runs in the forward direction while the key is held down.
- 13 The motor runs in the reverse direction while the V key is held down.

2.4.4 Speed Reference Offset Adjustment

When user constant Cn-00 is set tool, the system enters the speed reference offset adjustment mode.

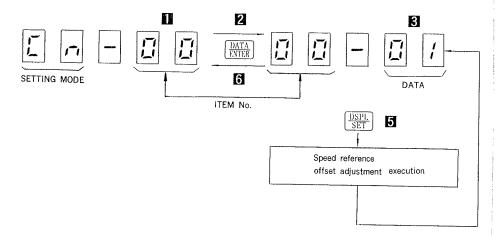

Fig. 2.7 Speed Reference Offset Adjustment

- \blacksquare Select the item number 00 with the \frown , \bigvee , \bigcirc or \bigcirc key.
- With the ENTER key, display the data related to the selected item number.
- 3 With the \bigwedge , \bigvee , \bigcirc or \bigcirc key, select the number 01.
- 4 Apply the desired zero speed reference voltage with speed reference input. Apply the desired zero torque reference voltage with torque reference input.
- With the DSPL sey, make speed reference offset adjustment and return to the user constant Cn-00 data display status.
- 6 With the $\frac{\text{DATA}}{\text{ENTER}}$ key, return to the item No. display status.
- Using the DSPL | key, switch from the setting mode to the monitor mode.

2.4.5 Clearing Fault Traceback Data

When user constant Cn-00 is set to 02, fault traceback data are cleared.

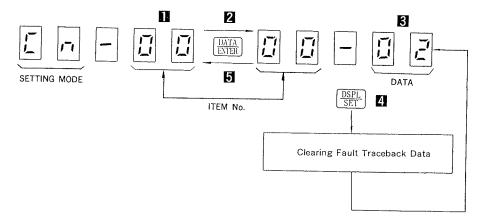

Fig. 2.8 Clearing Fault Traceback Data

- \blacksquare Select the item number 00 with the \frown , \bigvee , \bigcirc or \bigcirc key.
- With the ENTER key, display the data related to the selected item number.
- \blacksquare With the \frown , \bigcirc , \bigcirc or \bigcirc key, select the number 02.
- 4 With the SET key, clear fault traceback data and return to the user constant Cn-00 data display status.
- **5** With the $\frac{\text{DATA}}{\text{ENTER}}$ key, return to the item No. display status.
- 6 Using the SET key, switch from the setting mode to the monitor mode.

2.4.6 Speed Reference Offset Manual Adjustment

(1) Mode Setting in Speed Reference Offset Manual Adjustment

Basic functions are the same as for speed reference offset adjustment. The amount of offset can be input directly.

When user constant Cn-00 is set to 03, the system enters the speed reference offset manual adjustment mode.

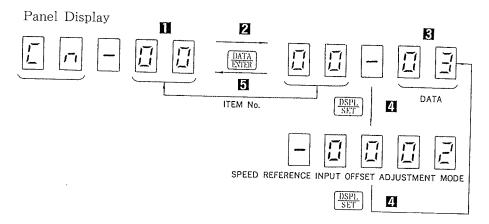

Fig. 2.9 Speed Reference Offset Manual Adjustment Mode

- Set up item number 00 with the ∧, ∨, < or > key.
- With the DATA key, display the data related to the selected item number.
- **3** With the , , , or , key, select the number 03.
- \blacksquare With the $\left(\frac{\text{DSPL}}{\text{SET}}\right)$ key, switch the adjustment mode.
- **5** With the $\frac{DATA}{ENTER}$ key, return to the item No. display status.
- 6 Using the SET key, switch from the setting mode to the monitor mode.

(2) Speed Reference Offset Manual Adjustment

Input a voltage that will obtain zero speed reference to the speed reference input. Input a voltage that will obtain zero torque reference to the torque reference input. (Normally 0V)

- While the key is held down, the offset is added to the forward running side.
- While the V key is held down, the offset is added to the reverse running side.
- Using the DSPL key, store offset data, then enter the monitor mode.

Offset adjustment is performed so that the LED indication may basically become zero; however, the perfect zero status of indication does not always offer optimum adjustment. Therefore, adjust the offset carefully, taking actual motor rotation into consideration.

2.4.7 Check of Motor

(1) Check Method of Motor

When user constant Cn-00 is set to 04, the system enters the motor check mode.

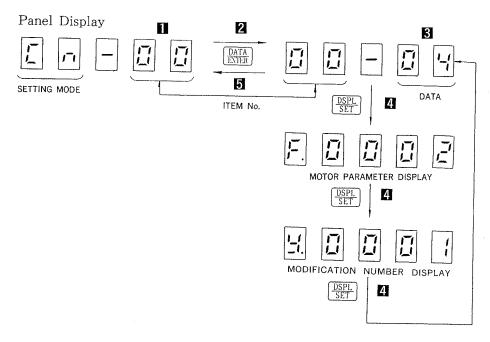

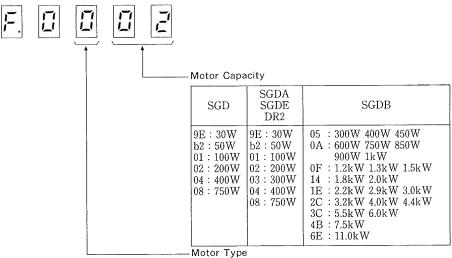

Fig. 2.10 Stritch Functions in Motor Parameter Check

- In Set up item number 00 with the \bigcirc , \bigcirc , \bigcirc or \bigcirc key.
- 2 With the DATA key, display the data related to the selected item number.
- With the , , , or > key, select the number 04.
- 4 With the $\frac{\text{DSPL}}{\text{SET}}$ key, check the motor parameter.
- **5** With the $\frac{\text{DATA}}{\text{ENTER}}$ key, return to the item No. display status.
- 6 Using the DSPL sey, switch from the setting mode to the monitor mode.

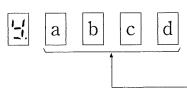

(2) Parameter Display

Motor Parameter

SGD	SGDA DR2	SGDE	SGDB	
0 : SGM200V 1 : SGM100W	0 . DOI	4 : SGME200V 5 : SGME100V	0 : ΣSeries	

Modification Index

Modification No. (Hexadecimal display)

 $(a \times 16^3 + b \times 16^2 + C \times 16 + d) = Modification No.$

Nos. Corresponding to Alphabets

A = 10

b = 11

C = 12

d = 13

E = 14

F = 15

2.4.8 Auto Tuning

(1) Mode Setting in Auto Tuning

When user constant Cn-00 is set to 05, the system enters the auto tuning mode.

Panel Display

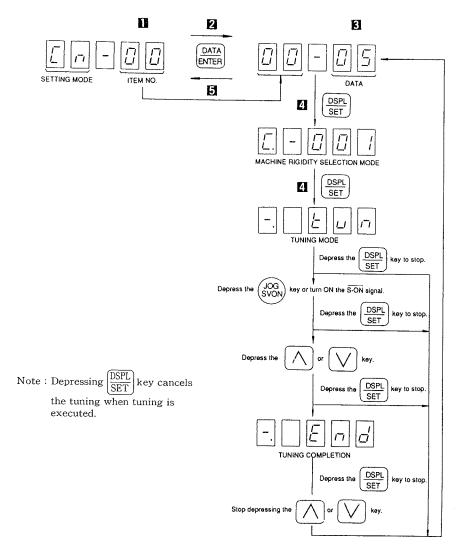

Fig. 2.11 Auto Tuning Mode

n	Set up item number 00 with the \bigcirc , \bigcirc , \bigcirc or \bigcirc key.
2	With the DATA key, display the data related to the selected item
	number. With the \(\sum_{\text{NSPL}} \), \(\sum_{\text{or}} \) key, select the number 05. With the \(\frac{\text{DSPL}}{\text{SET}} \) key, switch to the machine rigidity selection model.
	or tuning mode.
5	With the DATA key, return to the item No. display status.
6	Using the DSPL key, swich from the setting mode to the monitor
	mode.
	Tuning Method Speed setting When tuning is being performed, the maximum value of speed reference is set by user constant Cn-10. Set the value to approximately 500 r/min. (If the value is too small, auto tuning cannot be performed properly.) The motor runs intermittently when the \(\bar{\Lambda} \) or \(\bar{\V} \) key is held down. (The motor does not run at the same speed continuously.)
(b)	
	According to the machine rigidity, select the following: [
•]	Machine vibration
	When entering the servo ON status with the (\$VON) switch or machine vibrates suddenly at depressing the \(\bigcap\) or \(\bigcup\) key, depress the
	\(\begin{aligned} \begin{aligned} \text{DSPL} \\ \text{SET} \end{aligned} \text{key and stop the tuning operation.} \end{aligned}
,	Then depress the $\frac{DSPL}{SET}$ key to enter the machine rigidity selection
1	node and set the level of machine rigidity selection at one level lower

• When tuning is not completed
When tuning is not completed even though the machine does not vibrate
depress the DSPL key to stop the tuning operation.
Then depress the DSPL key to enter the machine rigidity selection
mode and set the level of machine rigidity selection at one level higher
(c) Tuning With the Syon switch, effect SVON/SVOFF changeover. The motor runs in the forward direction while the key is held down. The motor runs in the reverse direction while the key is held down. Note: If the machine vibrates when depressing the or key, stop depressing the or key since the gain is decreased.
With the tuning completion, - End is displayed and power supply to the motor is stopped. Stop depressing the or way key. Display is returned to UD-U5.
d) Input signals
• The P-OT signal, N-OT signal and SEN signal (absolute encoder only) are enabled during auto tuning. Input the P-OT signal, N-OT signal and SEN signal (absolute encoder only) during auto tuning. To conduct auto tuning without inputting these signals, set user constant Cn-01 Bits 1, 2, and 3 to 1.

- constant Cn-01 Bits 1, 2, and 3 to 1.
 Auto tuning is not possible during overtravel (P-OT or N-OT signal OFF).
- Conduct auto tuning when no overtravel has occurred (both P-OT and N-OT signal ON).

2.4.9 Check of Software Version

(1) Mode Setting in Software Version Check

When user constant Cn-00 is set to 06, the system enters the software version check mode.

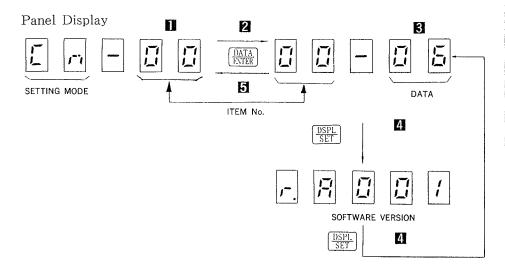

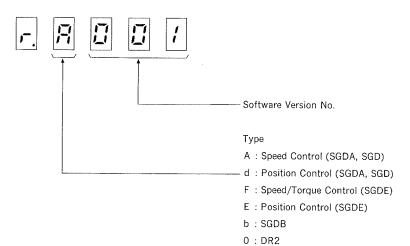

Fig. 2.12 Software Version Check Mode

- \blacksquare Set up item number 00 with the \frown , \bigvee , \bigcirc or \bigcirc key.
- 2 With the DATA key, display the data related to the selected item number.
- 3 With the \bigwedge , \bigvee , \bigcirc or \bigcirc key, select the number 06.
- 4 With the $\frac{|DSPL|}{|SET|}$ key, display the software version.
- **5** With the $\frac{\text{DATA}}{\text{ENTER}}$ key, return to the item No. display status.
- 6 Using the DSPL | key, switch from the setting mode to the monitor mode.

(2) Software Version Display

2.5 MONITOR MODE

In this mode, the speed reference, torque reference, and other data can be monitored on the digital operator.

Table 2.7 list the data that can be monitored

Table 2.19 Data Monitored

Monitor No.	Date Monitored	
0 0	Feedback Speed	(r/min)
0 1	Speed Reference	(r/min)
0 2	Torque Reference	(%)
0 3	No. of Pulses from Phase-U edge	(Pulse)
0 4	Electrical Angle	(deg)
0 5	Internal Status Bit Display 1	(Refer to Table 2.20)

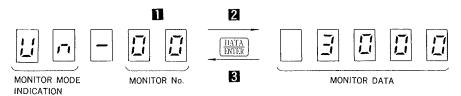

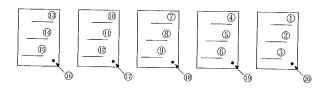

Fig. 2.13 Switch Functions in Monitor Mode

- With the ∧ or ∨ key, select a desired monitor No.
- 2 With the $\frac{DATA}{ENTER}$ key, initiate monitor display.
- Using the DATA key, return to the monitor No. selection status.
- With the DSPL key, switch from the monitor mode to the fault traceback mode.

Table 2.20 Bit Indication of Monitor Mode Un-05 Internal Status

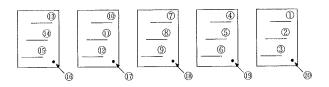

Bit No.	Symbol	Contents		Remarks
1	SVALM	Servo Alarm

2.6 FAULT TRACEBACK MODE

In this mode, information on past fault occurrences can be displayed.

- · Information on up to 10 past fault occurrences can be stored.
- When a fault is reset or the control power is turned ON, traceback data A.99 is saved. (These data are also counted as one of a total of 10 stored items of fault information.)
- For the relationship between traceback data and fault descriptions, refer to Table 2.20.

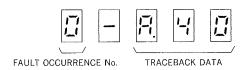

Fig. 2.14 Fault Traceback Mode

- With the $\frac{\overline{DSPL}}{\overline{SET}}$ key, select fault traceback mode.
- With the or wkey, increase or decrease the fault occurrence number. The fault information related to the selected number is then displayed. (The higher the fault occurrence number, the older the fault occurrence.)
- With the $\left(\frac{DSPL}{SET}\right)$ key, switch from the fault traceback mode to the status display mode.

Table 2.23 Error Displays With Digital Operator and Traceback Data

Digital Operator (Traceback Data)	Detection	Remarks
8. 00	Absolute Encoder Data Error	Only when absolute encoder is used (Type SGDB, DR2)
8, 8 (Absolute Encoder Data Error	Only when absolute encoder is used (Type SGDA).
R, D2	User Constant Breakdown	
8, 84	User Constant Setting Error	
8, 10	Overcurrent	
R. 20	Blown Fuse	Type DR2
R. 30	Regeneration Error	Type SGDB, DR2
0.40	Overvoltage	Type SGDA, SGDE, SGD

3. OPERATION MOTHOD OF HAND-HELD TYPE DIGITAL OPERATOR (JUSP-OPO2A-1) FOR POSITIONING CONTROL

This section explains the operation method when SERVOPACK for positioning control is operated using a hand-held type digital operator.

3.1 SWITCH OPERATION

Fig.3.1 shows the digital operator. The digital operator has various functions as listed by modes in Par.3.2, "DIGITAL OPERATOR FUNCTIONS" (p.34).

- 1. The data set by the digital operator is retained in SERVOPACK even after the power is turned OFF.
- 2. Even if the power is turned OFF after fault occurrence, the fault data is retained in memory. Therefore, it is possible to check the fault data after the power is turned back ON.
- 3. The monitor mode can be changed even during operations.

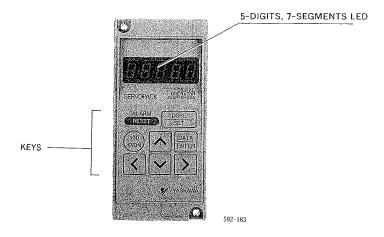

Fig. 3.1 DIGITAL OPERATOR (HAND HELD TYPE)
JUSP-OP02A-1

3.2 DIGITAL OPERATOR FUNCTIONS

Table 3.1 shows the digital operator's functions. The status display is the default when control power is turned ON. To change the mode, use

DSPL sey as shown in Fig.3.2.

Table 3.1 Digital Operator Functions

Mode	Function	
Status Indication Mode	Various Status Indications Base Block On Operation Fault	(See Par.3.3)
Setting Mode	Refer to "User Constant Setting." Operation (JOG) from digital operator Clearing Fault Traceback Data Check of Motor Auto Tuning Check of Software Version	(See Par. 3.4.1) (See Par. 3.4.3) (See Par. 3.4.4) (See Par. 3.4.5) (See Par. 3.4.6) (See Par. 3.4.7)

not	Reverse Running Prohibited	
R.Ū 0	Alarm Status Refer to Table 3.24.	

3.4 SETTING MODE

In this mode, the following operrations can be performed.

- OUser constant setup and monitor
- Jog operations from the digital operator
- Fault traceback data clearing
- Check of mother parameters
- Auto tuning
- Check of software version

3.4.1 User Constant (Data) Setup and Monitor (Cn-03 to Cn-27)

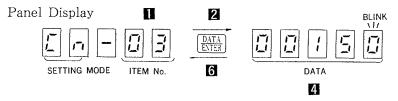

Fig. 3.4 User Constant Setting

- \blacksquare Set up the item number with the \frown , \bigvee , \bigcirc , or \bigcirc key.
 - With the (<) or (>) key, choose a setup digit. The chosen digit starts blinking to indicate that its numerical value can be changed.
 - With the or wey, increase or decrease the numerical value until the desired value is obtained.
- With the ENTER key, display the data related to the selected item number.
- With the \bigwedge , \bigvee , \swarrow , or \triangleright key, set up the data. (The same operation as stated in \blacksquare .)
- 4 Retain the data with the $\frac{\text{DSPL}}{\text{SET}}$ key.
- 5 Repeat steps 1 through 4 as needed.
- **6** With the $\frac{\text{DATA}}{\text{ENTER}}$ key, return to the item No. display status
- Using the DSPL key, switch from the setting mode to the monitor mode.

3.4.1 User Constant (Data) Setup and Monitor (Cont'd)

Table 3.4, 3.5, 3.6, 3.7, 3.8 show user constants (Constant Setting).

	Cn-16	BRKSPD	Brake Timing at Motor Rotation (Waiting time from SVOFF to brake reference output.)	10 ms	10	100	50	

100% = rated torque

Notes:

Factory setting of Cn-04 (speed loop gain) is determined by the following conditions:
 Load inertia ≤ motor inertia × 3
 Be sure to set the value of Cn-04 to 40 or less when motor is rotated without load. If the value has

been kept at the factory setting, the motor may oscillate.

After modifying Cn-0A, 11, 24 and 25, turn OFF power and start up again. The modified value takes effect only after restarting.

3. Electronic gear ratio (Cn-24, Cn-25) : $0.01 \le \frac{B(Cn-24)}{A(Cn-25)} \le 100$

4. Soft start function is effective at jog operation or internally set speeds selection. Soft start function is not effective when pulse train is used as reference.

100% = rated torque

- 1. Factory setting of Cn-04 (speed loop gain) is determined by the following conditions:

 Load inertia ≤ motor inertia × 3

 Be sure to set the value of Cn-04 to 40 or less when motor is rotated without load. If the value has been kept at the factory setting, the motor may oscillate.
- After modifying Cn-0A, 11, 24 and 25, turn OFF power and start up again. The modified value takes effect only after restarting.
- 3. Electronic gear ratio (Cn-24, Cn-25) : 0.01 $\leq \frac{B(Cn-24)}{A(Cn-25)} \leq 100$
- 4. Soft start function is effective at jog operation or internally set speeds selection. Soft start function is not effective when pulse train is used as reference.

- 1) After changing the setting, always turn the power OFF, then ON. This makes the new setting valid.
- 2) Automatically set by autotuning function.
- 3) The following restriction applies to electronic gear ratio (Cn-24 and Cn-25): $0.01 \le \frac{B (Cn-24)}{A (Cn-25)} \le 100$
- 4) For user constant Cn-1E, when full-closed loop specification, factory setting is 1.

3.4.2 User Constant (Memory Switch) Setup and Monitor (Cn-01 to Cn-02)

Memory switches Cn-01 and Cn-02 can be set up or monitored as memory switch bits. The procedures for item number setup and data display are the same as indicated in Par.3.4.1 \blacksquare and \blacksquare .

Panel Display

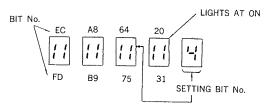

Fig. 3.5 Bit Data Display

- With the or key, enter the setup memory switch bit No. at the far right end of the panel.
- With the \(\bar{\Lambda} \) key, set the memory switch to ON or OFF (either \(\bar{\Lambda} \) or \(\bar{\V} \) can be used). The panel indication comes on when the switch is ON, and goes off when the switch is OFF.
- 3 Repeat steps 1 and 2 as needed.
- A Retain the data with the $\frac{DSPL}{SET}$ key.
- 6 Using the DSPL key, switch from the setting mode to the monitor mode.

Table 3.9, 3.11, 3.13, 3.15, and 3.17 show memory switches of user constant Cn-01, and Table 3.10, 3.12, 3.14, 3.16 and 3.18 those of user constant Cn-02.

Note: When the setting of user constants Cn-01 and Cn-02 are changed, turn OFF the power supply once and restart the operation.

Table 3.9 Type SGD User Constants Cn-01 (Memory Switch)

Selection	Bit No.	Setting	Conditions	Standare
Sequence Input Selection	0	0	Servo ON / OFF by external input (SV-ON).	0
		1	The servo is ON at all times.	
	1		Do not adjust.	0
	2	0	The P-OT signal prohibits forward running.	0
		1	Forward running is permitted at all times.	
	3	0	The N-OT signal permits reverse running.	0
		1	Reverse running is permitted at all times.	
Sequence Output Signal Changeover (TGON)	4	0	$\overline{\text{TGON}}$ signal is used as a signal output when rotating is detected. $(\overline{\text{TGON}})$	0
		1	TGON signal is used as a signal when current limit is detected.	
Treatment of Momentary Power Loss Reset	5	0	Maintains the servo alarm status at momentary power loss reset.	0
		1	Releases the servo alarm status automatically at momentary power loss reset.	
Abnormal Stop Selection	6	0	<db stop=""> The dynamic brake stops the motor.</db>	0
		1	<coasting a="" stop="" to=""> The motor is freed and brought to a stop.</coasting>	
	7	0	<db after="" db="" off="" stop=""> The dynamic brake is turned OFF after the motor is stopped.</db>	1
		1	<db after="" continuously="" db="" on="" stop=""> The dynamic brake remains activated after the motor is stopped.</db>	
	8	0	The overtravel state stop method agrees with bit 6.	0
		1	<overtravel speed="" stop="" zero=""> In the overtravel state, the motor is stopped at the torque setting defined by user constant Cn-06.</overtravel>	
	Note I	0	In the overtravel state, base blocking (BB) is implemented after zero speed stop. $ \\$	0
		1	In the overtravel state, zero clamping is effected after zero speed stop.	
Position Deviation at Base Blocking	А	0	Clears.	0 0
		1	Does not clear.	
Mode Switch Function	В	0	The mode switch function is provided. The mode switch operation agrees with bit C and D.	
		1	The mode switch function is not provided.	
Mode Switch Selection	Note 2 D • C	0.0	<torque reference=""> Based on the torque reference level defined by user constant Cn-0C.</torque>	
		0 • 1	Speed reference > Based on the speed reference level defined by user constant Cn-0D.	oc
		1 • 0	<pre><acceleration> Based on the acceleration level defined by user constant Cn-0E.</acceleration></pre>	
		1 • 1	<deviation pulse=""> Based on the deviation pulse level defined by user constant Cn-0F.</deviation>	
Encoder Selection	E	0	Incremental encoder	0
		1	Absolute encoder	
Spare	F		Do not change.	0

Notes: 1. Selects the state prevailing when the zero speed stop method has been selected for the overtravel state (bit 8).

^{2.} Selects the mode switch operating condition. When the mode switch operates, the speed control mode changes from P•I control to P control.

Table 3.10 Type SGD User Constants Cn-02 (Memory Switch)

Selection	Bit No	Setting	Description	Standard
Reverse Rotation Mode	0	0	CCW:Forward Running	0
		1	CW: Forward Running	
Home Position Error Mask	1 (ABSO. PG only)	_0	Home position error is detected.	0

- 4 At full-closed loop specification, factory setting Cn-02 bit B is 1.

NOTE For the Cn-01 and Cn-02 memory switches, always turn the power OFF and then ON after changing the setting. This makes the new setting valid.

3.4.3 Digital Operator Jog Operation Mode Selection and Operating Procedure

(1) Digital Operator Jog Operation Mode Selection

When user constant Cn-00 is set to 00, the operations are to be controlled from the digital operator.

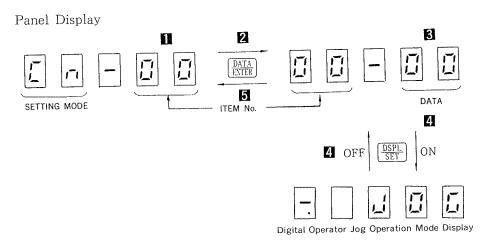

Fig. 3.6 Digital Operator Jog Operation Mode

- \blacksquare Select the item number 00 with the \frown , \bigvee , \bigcirc or \bigcirc key.
- With the ENTER key, display the data related to the selected item number.
- \blacksquare With the \bigcirc , \bigcirc , \bigcirc or \bigcirc key, select the number 00.
- 4 With the SET key, turn ON or OFF the monitor panel jog operation mode.
- **5** With the $\frac{\text{DATA}}{\text{ENTER}}$ key, return to the item No. display status.
- 6 Using the SET key, switch from the setting mode to the monitor mode.

(2) Digital Operator Jog Operation Procedure

For speed reference adjustment, use user constant Cn-10 (see Table 3.4).

- With the (SVON) switch, effect SVON/SVOFF changeover.
- 2 The motor runs in the forward direction while the key is held down.
- 3 The motor runs in the reverse direction while the V key is held down.

3.4.4 Clearing Fault Traceback Data

When user constant Cn-00 is set to 02, fault traceback data are cleared.

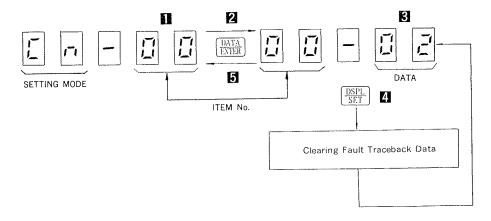

Fig.3.7 Clearing Fault Traceback Data

- \blacksquare Select the item number 00 with the \frown , \bigvee , \bigcirc or \bigcirc key.
- With the DATA key, display the data related to the selected item number.
- **3** With the \bigwedge , \bigvee , \triangleleft or \triangleright key, select the number 02.
- 4 With the SET key, clear fault traceback data and return to the user constant Cn-00 data display status.
- **5** With the $\frac{\text{DATA}}{\text{ENTER}}$ key, return to the item No. display status.
- 6 Using the SET key, switch from the setting mode to the monitor mode.

3.4.5 Check of Motor

(1) Check Method of Motor

When user constant Cn-00 is set to 04, the system enters the motor parameter check mode.

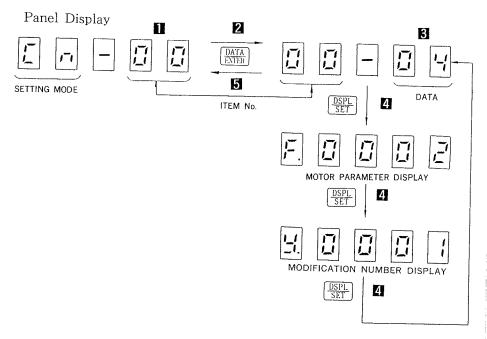

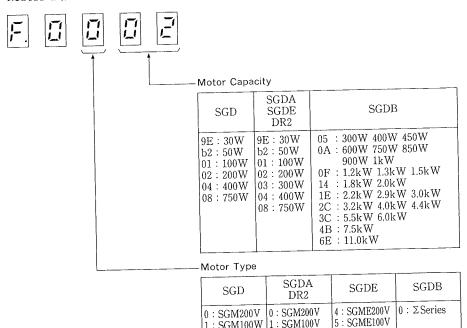

Fig. 3.8 Switch Functions in Motor Parameter Check

- \blacksquare Set up item number 00 with the \frown , \bigcirc , \bigcirc or \bigcirc key.
- With the DATA key, display the data related to the selected item number.
- 3 With the , , , or > key, select the number 04.
- \square With the $\frac{|DSPL|}{|SET|}$ key, check the motor parameter.
- **5** With the $\frac{\text{DATA}}{\text{ENTER}}$ key, return to the item No. display status.
- 6 Using the DSPL sey, switch from the setting mode to the monitor mode.

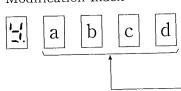

(2) Parameter Display

Motor Parameter

Modification Index

Modification No. (Hexadecimal display)

2: SGMP200V 3: SGMP100V

 $(a \times 16^3 + b \times 16^2 + C \times 16 + d) = Y$ Specification No.

Nos. Corresponding to Alphabets

A = 10

b = 11

C = 12

d = 13

E = 14

F = 15

3.4.6 Auto Tuning

(1) Mode Setting in Auto Tuning

When user constant Cn-00 is set to 05, the system enters the auto tuning mode.

Panel Display

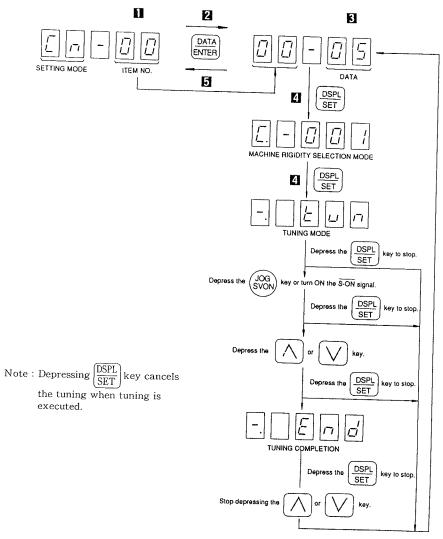

Fig. 8A.9 Auto Tuning Mode

	Set up item number 00 with the \bigcirc , \bigcirc , \bigcirc or \bigcirc key.
	With the $\overbrace{\text{ENTER}}^{\text{DATA}}$ key, display the data related to the selected item
3	number. With the , , ,
4	With the SET key, switch to the machine rigidity selection mode
	or tuning mode.
5	With the DATA key, return to the item No. display status.
6	Using the DSPL swich from the setting mode to the monitor
	mode.
(2)	Tuning Method
(a	When tuning is being performed, the maximum value of speed reference is set by user constant Cn-10. Set the value to approximately 500 r/min. (If the value is too small, auto tuning cannot be performed properly.) The motor runs intermittently when the or we key is held down. (The motor does not run at the same speed continuously.)
(b) Machine rigidity selection According to the machine rigidity, select the following:
	According to the machine rigidity, select the factor of the machine rigidity.
	[-] [] : Medium response
	FINAL: High response
	When the machine rigidity is not defined, select the middle - speed
	response.
	• Machine vibration When entering the servo ON status with the swon switch or key.
	machine vibrates suddenly at depressing the \(\int\) or \(\nabla\) key,
	depress the SET key and stop the tuning operation.
	Then depress the DSPL key to enter the machine rigidity selection
	mode, and set the level of machine rigidity selection at one level lower.

 When tuning is not completed When tuning is not completed even though the machine does not vibrate, depress the
(c) Tuning
 With the (SVON) switch, effect SVON/SVOFF changeover. The motor runs in the forward direction while the key is held down. The motor runs in the reverse direction while the key is held down.
Note: If the machine vibrates when depressing the or we key, stop depressing the or we key since the gain is decreased.
With the tuning completion, - End is displayed and power supply to the motor is stopped. Stop depressing the or key. Display is returned to End - End is displayed and power supply to the motor is stopped.
(d) Input signals
 The P-OT signal, N-OT signal and SEN signal (absolute encoder only) are enabled during auto tuning. Input the P-OT signal, N-OT signal and SEN signal (absolute encoder only) during auto tuning. To conduct auto tuning without inputting these signals, set user constant Cn-01 Bits 1, 2, and 3 to 1. Auto tuning is not possible during overtravel (P-OT or N-OT signal OFF). Conduct auto tuning when no overtravel has occurred (both P-OT and N-OT signal ON). If using the S-ON signal to set the servo ON status, display before turning ON the S-ON signal.

3.4.7 CHECK OF SOFTWARE VERSION

(1) Mode Setting in Software Verson Check

When user constant Cn-00 is set to 06, the system enters the software version check mode.

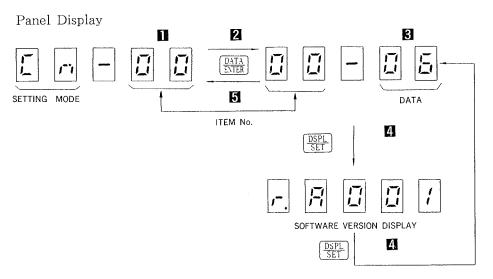

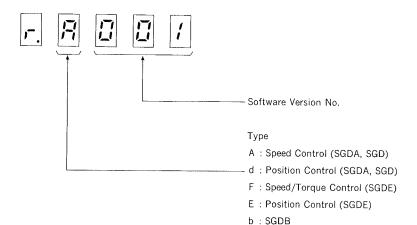

Fig. 3.10 Software Version Check Mode

- \blacksquare Set up the item number 00 with the \bigcirc , \bigcirc , \bigcirc or \bigcirc key.
- With the DATA key, display the data related to the selected item number.
- **3** With the \bigwedge , \bigvee , \bigcirc or \bigcirc key, select the number 06.
- 4 With the $\frac{\text{DSPL}}{\text{SET}}$ key, display the software version.
- **5** With the $\frac{\text{DATA}}{\text{ENTER}}$ key, return to the item No. display status.
- 6 Using the DSPL SET key, switch from the setting mode to the monitor mode.

(2) Software Version Display

0 : DR2

3.5 MONITOR MODE

In this mode, the speed reference, torque reference, and other data can be monitored on the digital operator.

Table 3.7 lists the data that can be monitored.

Table 3.19 Data Monitored

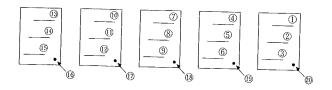

Monitor No.	Date Monitored	
0.0	Feedback Speed	(r/min)
0.1	Speed Reference (at external setting s	peed control) (r/min)
0.2	Torque Reference	(%)
0.3	No. of Pulses from Phase-U Edge	(Pulse)
0.4	Electrical Angle	(deg)
0.5	Internal Status Bit Display 1	(Refer to Table 3.20.)
0.6	Internal Status Bit Display 2	(Refer to Table 3.21.)
0.7	Speed Display of Reference Pulse	(r/min)
0.8	Position Deviation	(Pulse)

Fig. 3.11 Switch Functions in Monitor Mode

- With the ∧ or ∨ key, select a desired monitor No.
- 2 With the $\frac{\text{DATA}}{\text{ENTER}}$ key, initiate monitor display.
- Using the DATA key, return to the monitor No. selection status.
- 4 With the $\frac{DSPL}{SET}$ key, switch from the monitor mode to the fault traceback mode.

Table 3.20 Bit Indication of Monitor Mode Un-05 Internal Status (Type SGDA, SGDE, SGD)

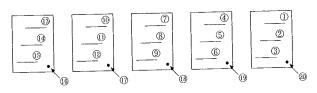

Bit No	. Symbol	Cor	Remarks				
	SVALM	Servo Alarm		Romana			
2	DBON	Dynamic Braking					
3	DIR	Reverse Run Mode					
4	TGON	Motor Running (Motor speed is TGON I	Select by setting of user constants Cn-01.				
	CLT	Torque Limit	(Type SGDE : TGON)				
	COIN	Position Completion	Position Completion				
	MSON	Mode Switch ON

9 to @		Not used	

3.6 FAULT TRACEBACK MODE

In this mode, information on past fault occurrence can be displayed.

- · Information on up to 10 past fault occurrence can be stored.
- · When a fault is reset or the control power is turned ON, traceback data A.99 is saved (These data are also counted as one of a total of 10 stored items of fault information.)
- \cdot For the relationship between traceback data and fault descripitions, refer to Table 3.24

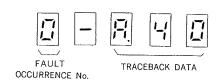

Fig. 3.12 Fault Traceback Mode

- With the $\left(\frac{\text{DSPL}}{\text{SET}}\right)$ key, select fault traceback mode.
- With the \(\cap \) or \(\varphi \) key, increase or decrease the fault occurrence number. The fault information related to the selected number is then displayed. (The higher the fault occurrence number, the older the fault occurrence.)
- With the $\frac{DSPL}{SET}$ key, switch from the fault traceback mode to the status display mode.

Table 3.24 Error Displays With Digital Operator and Traceback Data

Digital Operator (Traceback Data)	Detection	Remarks
8. DD	Absolute Encoder Data Error	Only when absolute encoder is used (Type SGDB, DR2)
8, 0 1	Absolute Encoder Data Error	Only when absolute encoder is used (Type SGDA).
8.02	User Constant Breakdown	
8, 84	User Constant Setting Error	
8 10	Overcurrent	
8 20	Blown Fuse	Type DR2
R. 30	Regeneration Error	Type SGDB, DR2
8.31	Position Error Pulse Overflow	Type DR2
	Overvoltage	Type SGDA, SGDE, SGD
8, YO	Main Circuit Voltage Error	Type SGDB
8.51	Feedback Overspeed	Detected at 110% of max. speed.
8. 10	Overload	Type SGDA, SGDE, DR2
8 71	Overload	Momentary overload
8, 72	Overload	Continuous overload
8. 80	Absolute Encoder Error	Only when absolute encoder is used (Type SGDA, SGDB, DR2)
8.81	Absolute Encoder Backup Error	Only when 12-bit absolute encoder is used.
8.82	Absolute Encoder Check sum Error	Only when 12-bit absolute encoder is used.
R. 83	Absolute Encoder Battery Alarm	Only when 12-bit absolute encoder is used.
8, 84	Absolute Encoder Data Error	Only when 12-bit absolute encoder is used.
8, 85	Absolute Encoder Overspeed	Only when 12-bit absolute encoder is used.
8.81	Heat sink overheat	Type SGDB
8.61	Reference Input Read Error	
8.61	Overrun	
8, E2	Encoder Phase Detection Fault	Only when incremental encoder is used.
8. 03	PA-, PG-phase Disconnection of PG Signal Line	
8. E Y	PC Disconnection	
я. С 5	Incremental Encoder Initial Pulse Error	Type DR2
Я. СЬ	Full-closed Loop A-, B-phase Disconnection	Type DR2
R. E 7	Full-closed Loop C-phase Disconnection	Type DR2
8.51	Power Supply Line Open Phase	Type SGDB
8, 53	Momentary Power Loss Error	
8 39	Not Applicable to Alarm	
	Digital Operator Transmission Error	Digital operator error
C P F 00	Digital Operator Transmission =	Not detected as traceback data.
