Subject: MOTIONWORKS+ VERSION 2.14 RELEASE

Product: MW+

Released February 2001

General Changes

1) This software has some bugs fixed that were found in the previous release version of MotionWorks+, version 2.05.

2) The Archive tool has been added. The user can now upload a project from a controller or download a project to a controller without having to open the MotionWorks+ software package. It is a separate utility tool. The user still needs to have the MotionWorks+ software installed but they do not need to have MotionWorks+ open when doing the archive or restore function.

3) The Save Project As and Save Program As feature was added. The user can now create a backup copy of their project or program to make test changes for without affecting the original files.

4) The newest version of CimScope, version 0.36B, is also installed with this version of MotionWorks+. There were many fixes to this utility, especially to fix problems pertaining to download of projects and connection reliability when going online.

5) There is a new System Ladder Version 222. It has improved rotary mode operation, improved absolute encoder operation, and improved cam operation.

6) The "Compile Options" selection has been removed from the tools pull down menu.

7) There is a new item, "Revert to default layout" that is added to the view pull down menu. If the toolbars need to be reset to original sizes and positions, use this option.

8) There is some added information in the Help / About screen. The user is now able to view the current installed versions of MotionWorks+, Communication Manager, CimScope, and Cam Tool as well as the current serial number of MotionWorks+.

The projects that are provided in the example folder have all been update and slightly changed to show more of the features available in the icons.
