Configuring an Exor UniOP HMI u	sing JMobile software to communicate Modbus TCP	with an MPiec Series Controller via

Application Overview:

This document will guide the user through the steps of configuring an Exor UniOP HMI using JMobile software to operate as a Modbus TCP master communicating with an MPiec Series Controller configured as a slave.

Figure 1: Overview of hardware setup

YASKAWA		
Subject: Application Note	Product: MPiec Series Controller	Doc#: AN.MPIEC.10
Configuring an Exor UniOP HMI	using JMobile software to communicate v	vith an MPiec Series Controller via

Configuration Overview:

Set the IP addresses of each of the devices (HMI, Controller, PC). In our configuration, the IP addresses were: 192.168.207.205 (MP Controller), 192.168.207.20 (HMI), 192.168.207.78 (PC).

Figure 2 shows the Modbus memory map of MPiec Series Controllers, and how it relates to the IEC Global Variables in MotionWorks IEC. Note that function codes 01 and 03 return data that was sent to the controller from the master and do not reflect data in the Global Variables of the IEC application program.

Modbus registers are copied to the Global Variables at the IEC task update rate which the Modbus driver is synchronized with. If using MotionWorks IEC Express, there is only one task. If using Pro, this is selected in the Hardware Configuration.

Modbus coil 0 equates to the Global Variable at %IX24560. 128 coils are available. Modbus register 40000 equates to the Global Variable at %IW28672. 1024 registers are available. Modbus input 10000 equates to the Global Variable at %QX24560. 128 inputs are available. Modbus register 30000 equates to the Global Variable at %QW28672. 1024 registers are available.

Figure 2: Modbus register mapping to IEC address

As shown in Figure 2 above, the input and output IEC addresses map to a different modbus register.

MotionWorks IEC Configuration:

To configure the MPiec Series Controller as a Modbus server (slave), launch the Hardware Configuration and connect to the MPiec controller. See Figure 3 to correctly select the controller to operate as a Modbus server (slave). Save the configuration and reboot the controller.

Figure 3: Configuring the MPiec Series Controller as a Modbus slave

The above configuration steps create Modbus TCP groups in the Global variables worksheet in MotionWorks IEC. Variables must be added to each group as shown in Figure 4. It is important to set the correct data type and memory address in the Global variables worksheet. After creating Modbus variables, compile and download the project to the controller. In the resource dialog box, run the IEC program by pressing warm start.

	🗆 Modbus FC#05 Qty: 128	Coils, Address Rang	e: %IB24560 - %IB	24575

Figure 5: Configuring the Modbus driver in JMobile

Add tags under the tags tab as shown in Figure 6.

Name	Group	Driver	Address	Comment	B/W	Active	
EC_To_Exor_BOOL		Modbus TCP:prot1	1 INP 100001 boolean		B	false	Variables
Exor_To_IEC_BOOL		Modbus TCP:prot1	1 OUTP 1 boolean		W	false	Variable:
EC_To_Exor_REAL		Modbus TCP:prot1	1 IREG 300001 float		B	false	Variable:
Exor To IEC REAL		Modbus TCP:prot1	1 HREG 400001 float		B/W	false	Variable:

Add widgets to the HMI page from the widget gallery. Right click on the widget and attach it to a Modbus tag.

Figure 7: Adding tags in JMobile

Select the tag that should be associated with the widget and click OK.

Modbus TCP

Figure 9: Setting widget properties

Download the project to the target HMI. Run the project.

Execution:

Communication between the Exor UniOP HMI and the Yaskawa MPiec Series Controller should commence as soon as the two projects start running.

MPiec variable	IEC address		Modbus Register	UniOP tag
Exor_To_IEC_BOOL	%IX24560.0	•	1	Exor_To_IEC_BOOL
