© 2017 Yaskawa America, Inc.

This video shows how to get started with Yaskawa's SmartPanel HMI.

3

Instructor Introduction

Matt Pelletier Product Training Engineer <u>training@Yaskawa.com</u> 1-800-YASKAWA

YASKAWA

Hi, I'm Matt Pelletier

# **Quick Preview**

- Hardware Setup
- Variable Import
- Simple HMI screen
- Runtime Simulation
- Run SmartPanel HMI

Here's a quick preview of the process

Start a new Movicon project and import the variables marked "OPC" from the controller

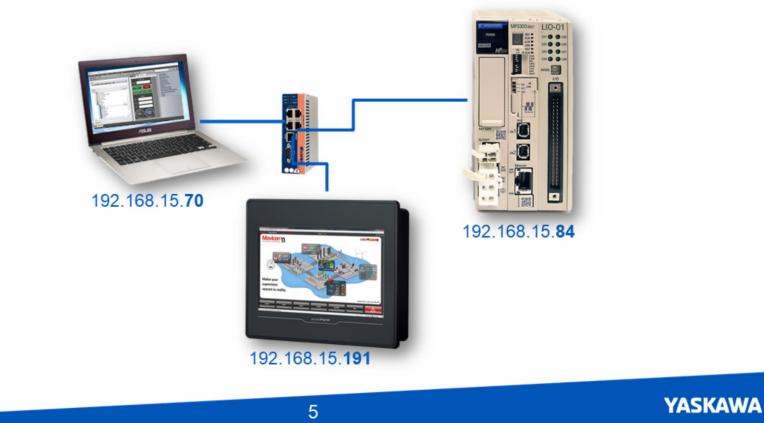

Connect buttons and edit boxes to these variables and adjust the properties Test functionality in the runtime simulation Then set up the HMI to run the project

Now let's look at this in more detail.

## Hardware Setup

#### Connections

Here's the system and hardware I'm working with.

I have an Ethernet connection between my PC, a 7 inch SmartPanel HMI, and MP3300iec machine controller. You can see the unique IP addresses of each device, each on subnet 15 in this case.

# Hardware Setup

### **Global Variables Marked OPC**

	Address	Init	Retain	PDD	OPC	TB	Hid.	. Init	Default Hid	^

I'm running MotionWorks IEC version 3.6 and the MP3300iec is running this simple program with four global variables and simple code to convert data

I would like to manipulate and display this data in the HMI panel, which right now is at factory condition.

YASKAWA

The first step is to mark the OPC property for the variables in the global variables list These marked variables will be accessed by the HMI using the PLCI communication protocol. Standard Modbus protocol is also supported by the HMI, but PLCI is much faster and easier to use.

PLCI also supports structure datatypes so I'll mark a structure here such as PLCTask1 so you can see how that works.

Let's run this on the controller

# Variable Import

List Available Comm.Drivers       Comm.Driver Properties         Systeme Helmholz       Image: Systeme Helmholz         WITS       VIPA         YASKAWA       Image: Second and the systeme temperature of temper	Add Comm. I/O Driver		×

1

Next let's import those variables into a Movicon project. I'm using version 11.6

Start a new project and choose WinCE Platform

YASKAWA

I'll name it Quickstart in the default folder Keep users at default for now In "Add comm driver", go down to Yaskawa MPiec PLCI, next The screen size of the 7" smart panel is 800 wide by 480 high. And I'll change the default color to custom Yaskawa blue (0,90,194), next Datalogger and recipies, leave at default... alarm settings leave default. And finish Any of these settings can be changed later.

# Variable Import

8

Next is a prompt to set up the PLCI driver.

All this means is to specify the IP address of the MPiec controller and give it a name.

The controller is considered a "station", so under the stations tab ADD

YASKAWA

Expand the properties to set Server Address Expand general to set Station Name = MP3300iec (whatever name you want) OK and OK that's it

# Variable Import

### Import Screen

News	Tree	Address	Con L	2000	Colord All	1	
Name	Туре	Address		Desc	Select All		
GlobalVariables.HMI_TestOut_IN	INT	@GlobalVariables.HM			Select None	1	
@GlobalVariables.HMI_TestIN_LREAL	LREAL	@GlobalVariables.HM				1	
GlobalVariables.HMI_TestCoil	BOOL	@GlobalVariables.HM			Browse File	1	
@GlobalVariables.HMI_TestContact	BOOL	@GlobalVariables.HM				1	
@GlobalVariables.PLC_TASK_1.Name	String	@GlobalVariables.PL			Get PLC Tags	1	
GlobalVariables.PLC_TASK_1	TASK_I	@GlobalVariables.PL	88		Get FLC Tags		
					?		
					Expand All		
						Libraries 🔧 F	
					Collapse All	r	
				_		sert - N S	
						PART I PA SA	
					Incent	1	
•				•	Import	1	
Add Station Name	Stat	ion: MP3300iec		•	Cancel	1	

Here's the part we wanted to get to and that's to import tags from the PLC, so Yes Since my PC is connected to the controller, the easiest way to import is "Get PLC Tags" You can see PLC\_Task\_1 was imported as two structures.

You could prefix the variables with the station name

if there are several stations in the system.

If you're not connected to the controller, it's also possible to browse for the MWT file and import the variables.

Select all the variables and click Import

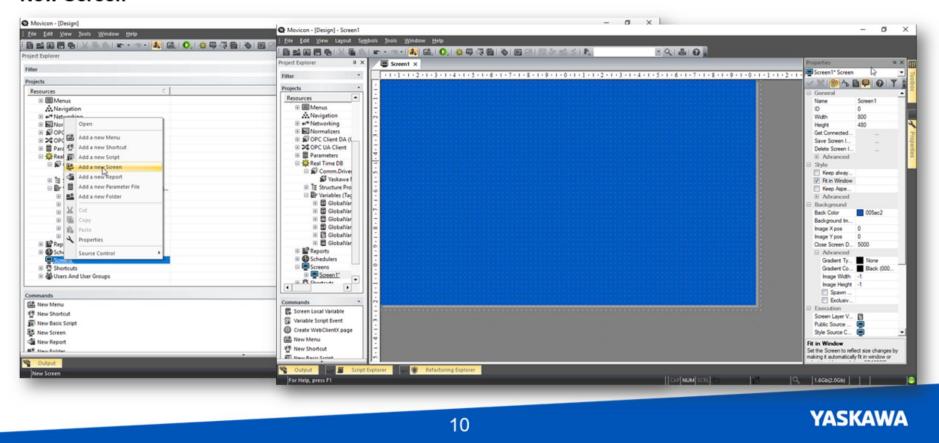

You'll see all the variables in the Project Explorer under Real Time DB

If you're having trouble getting this to work, confirm you typed in the controller IP address

in the driver under Real Time DB, Comm.Drivers

And you can always import again by right clicking the comm driver

# Simple HMI Screen

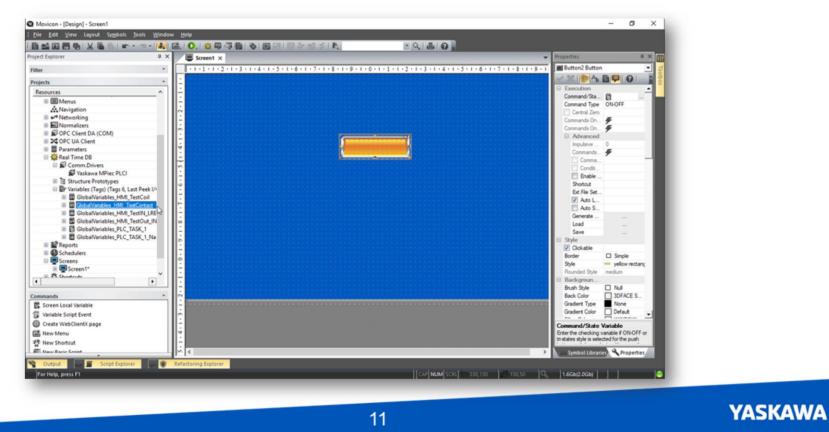

OK now it's time to make a simple screen

In the project explorer under screens there are none yet, so right click to add a new screen and Name it.

# Simple HMI Screen

The buttons and lights etc for the screen are found in the toolbox window. Let's start with a button. I'll use a rectangular button and choose yellow (and center it) I want it to turn on the contact in the ladder code so drag the variable onto the button.

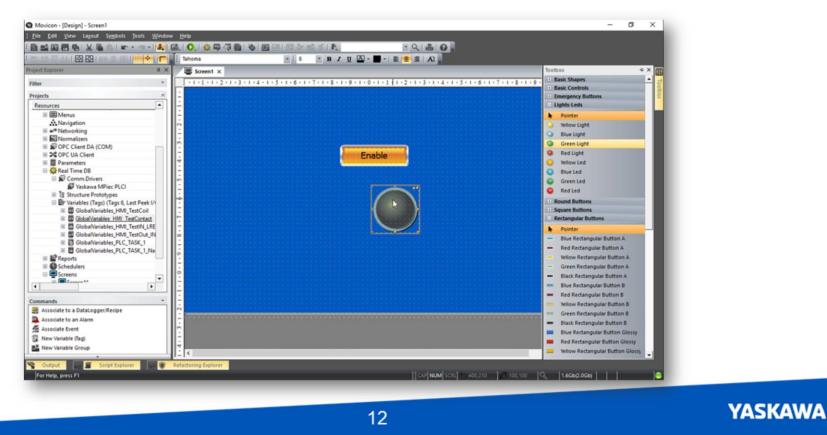

Maybe I want to call this button "Enable" so click, type and adjust the font.

Toolbox: Rectangular Buttons Drag a button onto screen Drag variable onto the button Execution.Command Type = Impulsive

# Simple HMI Screen

I''d also like an indicator lamp for the relay coil

In the Toolbox under lights I'll drag in a green light and name it status

There's another way to add the variable, and that's in the properties window under Command/State

Variable click the gray box with the ellipsis.

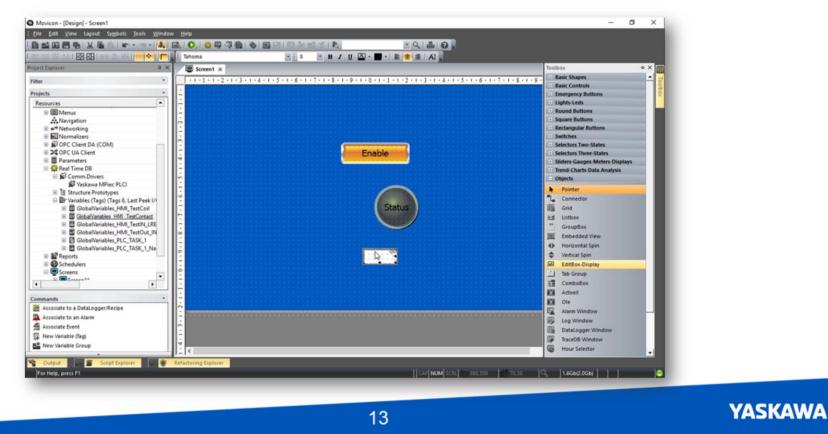

This brings up the tag browser with handy filter feature. For example I can search for \*HMI\* to narrow it down and choose the variable.

Toolbox: Lights-LEDs

Drag onto screen Another way to assign a variable is Properties → Command/State Variable → "…" (ellipsis) Execution.Command Type = ON-OFF

# Simple HMI Screen

To display or edit the Ireal or integer data, in the toolbox go to objects and user Edit Box Display I'll name the first one input, make it a little bigger and set the font size And drag the global variable.

Since this is an LREAL datatype, change the format value to x.x to allow one digit after the decimal point.

Also notice the max and min values.

I'll do this again to add another edit box for the integer.

For this one under style I'll select Read Only and turn off spin enable. Click the checkbox to apply.

To edit or display numeric data use the combo box object Toolbox: Objects → Combo Box

> Drag onto screen Properties → EditBox-Display Variable → "..." or drag variable from Project Explorer

I need one for input data to the controller And one for output data from the controller

# **Runtime Simulation**

#### Start Runtime

w <u>H</u> elp 🛎,   🔨   🎄 🤀 🖓 🔯   🇞   💷 🐼   🗟 🏷 📫 🎸	
Tah Start Project (Alt+F12) • 12 •	
Start the current Project	
=	
-	
•	
<ul> <li>Alberta andre alberta en antaria de antaria en antaria de la contra en alternativa de la contra en al</li></ul>	
	Start the current Project

For neatness, multiple items can be selected and then distributed into rows and columns aligned, resized, and centered. <do all this until they are neatly centered in the middle >

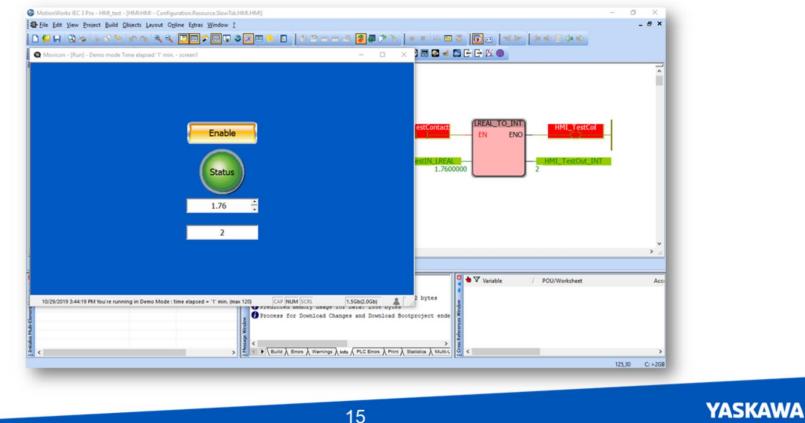

Let's test how this works within Movicon using Start Project and save. This launches the onscreen runtime simulation. OK

# **Runtime Simulation**

### MotionWorks IEC

Here's what the HMI will look like and the IEC code it interacts with.

I'll hit the button... and true shows on the controller, sets the coil, and displays the status on the HMI Set the numeric value in HMI... displayed in Mwiec

And the output is displayed. Looks like it's working

## Run SmartPanel HMI

#### System Main Menu

16

YASKAWA

The runtime simulator is convenient for testing screens during development without a real HMI

But now let's run this on the SmartPanel hardware

For convenience, I'm showing the smartpanel screen through VNC viewer.

Power on the HMI and when you see the blue boot screen with two buttons, press "main"

## Run SmartPanel HMI

Set IP Address

17

YASKAWA

Here in main there are a number of things you can do and the most important is to set a static IP address. Go to settings, Lan settings, and open the existing connection CPSW3G2. Enter the IP address and subnet mask you wish to use.

In my setup it was 192.168.15.199 Close the screen, and OK to save the settings permanently

## **Run SmartPanel HMI**

Clock

18

You may wish to open the control panel to set the date and time or other settings. Otherwise press back to return to the main menu

## Run SmartPanel HMI

### Autostart

Runtime Start Runtime Path			
ViahdskWorCEWorCE.exe[11.5.1184. Project.Path / Parameter	5]		
Flashdskt/Apr/9353M4pin4.mosprj			
Delay Time (seconds)	- Rotation	O 270°	
Program Start			
Name Action Boon copy Phogram copy		+	Edit
		-	
Autostart			
VMC Server	🗹 Autostart VipaStartup		Back

19

YASKAWA

Next look at Autostart

There are a few settings under the Autostart menu and lets focus first on the bottom.

Check all of the boxes at the bottom under Autostart.

VNC server allows you to use your computer to access the hmi like I'm using to record this video (zoom out to show!)

MoviCon TCP Upload server must be selected so that you can upload the project from movicon.

Autostart VipaStartUp causes the HMI project to load automatically

At the top, Runtime Start, project path / parameter refers to the project that loads when the smartpanel powers up.

You'll want to replace the default project with your own.

But we can't do that yet because the project hasn't been uploaded!

# Run SmartPanel HMI

### Upload

FTP	Upload Project!
MS ActiveSync	Start Device Project
ТСР	Attach To Process
< >	Stop Device Project!
Server : 192.168.15.199	K Erase Device Memory Car
User Name :	Create Device Shortcu
Password :	Close
Upload Device Path: \Flashdisk\MovPRJ\	
Upload Device Path: \Rashdisk\MovPRJ\	

20

Back in MoviCon go to the icon called upload project to device.

Set the server to the ip address of the hmi.

Browse for the upload device path such as flashdisk mov prj

YASKAWA

Hit upload and there's a warning about no startup screen.

TO fix that, click on the project name in the tree, and under Execution set the startup screen.

Also check the box to start full screen

And return to upload.

The first time you'll be prompted to install the PLCI driver

Upload Project to Device

PlugIn Type = TCP Server: = <ip address of HMI> Upload Device Path = "\Flashdisk\MovPRJ\" "Upload Project!" Use Default connection speed Overwrite Install PLCI driver

## Run SmartPanel HMI

### **Autostart Project**

Runtime Start	
Project Park (Constitution (Classified) (Cla	
Proc. FloridiskMorPRJ cysickstart.morprj.	
Autostart	
smartPanel	

21

YASKAWA

Now the project is in the HMI.

So navigate to choose it in the project path

Back all the way out to that first screen and this time press start

Run project on HMI at startup In the main menu select Autostart Project Path = downloaded project path Select "Back" twice Select "Start"

# **Run SmartPanel HMI**

#### Run

H 3& + 0 * 1	n ni (4, 6, 1 🛄	<b></b>	]≖ 🛸 🖬 🗍 🌢 🕾		•   44 📼 🥸   <b>[</b> 3 🖸 ≠ 🖬 🗗 (		(A 4) [] (A 4)	
		Ender			ACORDAL C	REAL_TO_INT EN ENO	HMI_TestCure HMI_TestCure 2	<b>^</b>
		2						~
				372		7 Variable	/ POU/Worksheet	 > _

Now the project is running and we have data communication just as before. Subsequent updates of the same project can be uploaded again. And the project can be started within Movicon **YASKAWA** 

# Thank You

Thank you for watching this video.
